Applesoft: VAL(A$) problems

```
=====================================================================
```

Applesoft running in a non-disk drive system won't initialize its memory
properly, resulting in the following program not giving the desired results.

```
100 GET A$
110 PRINT A$, VAL(A$)
```

If you input "1" the answer will be "1, 1.1111111E16". A "HIMEM:" statement
resets the pointer:

```
16K     HIMEM: 16384
32K     HIMEM: 32768
48K     HIMEM: 49152
```
