AppleShare: Types of Programs That Can Run in the Foreground

=====

This article last reviewed: 4 September 1987

These are the three major conditions that a program must meet for it to be an AppleShare foreground application:

- it must be of type FGND.
- it must be in the server folder (so AppleShare can find it) and it can save files only in the server folder (so as not to disrupt the desktop in a manner AppleShare cannot handle).
- it must call SYSTEMTASK often in order to give AppleShare run time.
