Macintosh: Control Panel 3.0 Incompatible with System 3.2

===

This article last reviewed: 3 September 1987

The new Control Panel 3.0 is not backward compatible with older System files. Previously, the setting of the mouse scaling option (set by the Control Panel and used by the System file) was stored in a single bit in the battery backed-up parameter RAM. Because the new system offers a larger choice of scaling options, the format of the saved setting had to change. This is why older version of the System file can't properly read the settings saved by the new Control Panel.
