MacTerminal and LisaTerminal: Line feeds after carriage returns

=====

It is the job of the sending device to provide line feeds after carriage returns if necessary. For example, when you're using your Macintosh to send text to another Macintosh, you must select New Line (a Terminal Settings option from the Settings menu); otherwise, the user on the other end will receive all the incoming text overwritten on one line.

In LisaTerminal, set Auto New Line to "on" to SEND a line feed after a carriage return. Auto New Line is an option in the Computer Compatibility box located in the Setup menu.
