AppleWorks IIe: Using codes for special text styles

=====

The word processor section of AppleWorks, when running on a IIe with Super Serial Card and Imagewriter, can produce text which is centered, underlined, boldfaced and superscripted.

Failures can occur, however, when:

1. The text file omits the codes to turn off the underline, boldface and superscript styles. This problem usually occurs when a carriage return is placed to turn off the styles.
2. The three special features are NOT turned off the order opposite from the order in which they were turned on. This occurs, for example, when the codes BB +B UB are followed by text and then +E BE UE. The codes BB +B UB should be followed by some text and then the codes UE +E BE.

The product manager has received reports of this problem.
