Macintosh Plus :Developer's Sw. Can Cause Resets

======================================================================

Article Created: 27 September 1985
Article Last Reviewed: 17 July 1992
Article Last Updated:

PROBLEM DESCRIPTION:  When the developer's switch is installed on the Macintosh
Plus, sometimes it will reset spontaneously.

CAUSE:   Insufficient clearance between the developer's
         switch and logic switch on the power/sweep board.

CURE: 1. Remove the developer's switch to determine if it was the
         cause.
      2. If the machine stops resetting spontaneously, file down
         the developer's switch approximately 1/16 to 1/8 of an inch.
      3. Replace the developer's switch onto the machine.
