HyperCard 1.2 and Mediagenic Reports: Problem and Workaround

===

This article last reviewed: 17 June 1988

When you upgrade from HyperCard 1.1 to HyperCard 1.2, Reports by Mediagenic
(formerly Activision) may not work correctly.

Here's the problem. In the background script of the report card are these
lines in the InvokeReports handler:

```
  - on InvokeReports docName:

    if the version is "1.0", then
      if MultiFinder(), then
    ...
    else if the version is "1.1", then
```

Here's the workaround: change the last line to read:

```
    else if the version >= "1.1", then
```
