HyperCard 1.2.1: Multilaunch Limitations Under AppleShare

==

This article last reviewed: 5 October 1988

HyperCard 1.2.1 on an AppleShare File server is a multilaunch application ONLY
if HyperCard and its Home stack are in a folder with read-only access.

If HyperCard is launched by a user with read/write access, HyperCard cannot
be run by anyone else. This has not changed with the new versions of
AppleShare.
