LaserWriter IINTX: Cached Fonts Are Available To Host Computer

=====

This article last reviewed: 11 October 1988

Fonts cached on a hard disk connected to a LaserWriter IINTX are a local resource to the printer, and not the system creating the document.

When a specific font is requested, the LaserWriter checks its local resources for the desired font and loads the font information.

This process is contained within the architecture of the LaserWriter interrupter, and is transparent to the user. No additional software or commands from the sending system are required.
