Ethernet, LocalTalk: Number Assignments Don't Affect Performance

==

This article last reviewed: 1 November 1988

When creating an Ethernet and LocalTalk network, performance is not effected if
the assigned network numbers are both high and low (for instance: 1,2 or
820,821)

It makes no difference what number is assigned since the field size remains
constant. If a small number is used and the field is not "filled", zeros
are transmitted as place holders.
