LocalTalk: High-Speed LAN Bridging at Speeds up to 57.6K BPS

=====

This article last reviewed: 5 January 1990

TOPIC -----

I need a high-speed LAN bridge to link buildings on a business "campus." Can you help me?

DISCUSSION -----

High-speed LAN bridging is possible with the Digital Access A-115 Asynchronous Line Driver and the Shiva TeleBridge. With these products, two LocalTalk LANs as far apart as 3.5 miles can be bridged at speeds up to 57.6K bps. All connections are over twisted-pair copper wiring. Installation is simple, and, because all connections are over existing wiring, there is no high installation cost. For more information, search the Tech Info Library under "Digital Access Corporation".
