Macintosh II Family: Monitor Power Receptacle Power Limit

=====

This article last reviewed: 11 May 1990

TOPIC -----

How much power can a monitor connected to the Macintosh II or Macintosh IIfx monitor input receptacle consume? I know how much the AppleColor RGB monitor consumes (160W), but is it possible to have a monitor connected that consumes more power?

DISCUSSION -----

Three amps at 110 volts (1.5 amps at 220 volts) is the maximum amount of power that can be drawn from any Macintosh II monitor power input receptacle. This means that 330 watts is the maximum wattage that can be pulled from the monitor power input receptacle.
