LaserWriter II: Printing 3x5 Labels, a Workaround

===

This article last reviewed: 12 June 1990

TOPIC ---

Do you have any kind of workaround for printing 3x5 labels on the
LaserWriter II?

DISCUSSION --

We constructed a "carrier" for small forms.   It is a piece of heavy paper
(about the same weight paper as 3x5 stock) cut to the size of a standard
envelope. It has a hole cut in it to print through and a standard piece of
paper glued to the back that adequately holds the small form in place. The
small form slides into place, and then We feed the carrier manually.

We do not propose this as a solution for the problem. It is much too
much trouble for large quantities. It does work very well when printing
single labels or small forms. We can even print individual disk labels with
this method. To make it even easier, we created a MacDraw II template that
shows me exactly where the window on the carrier is. We used the template to
create the carrier.

If this idea could be developed into a useful solution by some
industrious person, we wouldn't mind if they used it.
