AppleShare PC: 3.5-Inch and 5.25-Inch Install Disks

=====  
This article last reviewed: 16 November 1989

TOPIC -----

My office does not have a dual 5.25-inch drive PC. This makes it cumbersome to copy AFE the files, because when I find that they are the wrong ones, and have to go back to AFE. What files does install.exe look for when doing the four different installs (printing, printing, file access, and so on)?

DISCUSSION -----

AppleShare PC 2.0 shipped with both a 3.5-inch 720K install disk, and a set of 5.25-inch 360K install disks. The files contained on the 5.25-inch disks are no different than those on the 3.5-inch disk; they're just divided across two disks. However, as you have found, the distribution of the files is important.

Until you get the new version, you can make a functional set by creating two disks with the file distribution listed below. After you copy all the files, Disk #1 will have approximately 4K available, and disk #2 will have approximately 33K available. Neither has enough space for MS-DOS system files.

Workstation Disk #1
