Macintosh 12" RGB Display: Software Compatibility

=====

This article last reviewed: 15 October 1990

Several applications do not recognize the Apple Macintosh 12" RGB Display as being 512 x 384 pixels instead of 640 x 480. This leads to windows that are partially off the screen. ColorStudio 1.0 and PixelPaint 2.0 are two applications with this problem. In some cases, the windows can be resized -- but in others, there is no way to work with the application and restarting the system is the only way out.
