MacX and Extended Keyboard Mapping (5/95)

=====================================================================

Article Created: 21 January 1991
Article Reviewed/Updated: 1 May 1995

TOPIC -----------------------------------------------------------

Can you give me some information about MacX and extended keyboard mapping?

DISCUSSION ------------------------------------------------------

Unfortunately, there is no information on extended keyboard mapping in the "MacX
User's Guide." However, according to MacX engineering, the PATHWORKS "MacX
User's Guide" shows such a map in Chapter 1, Section "Mouse and Keyboard
Differences". For example, the "Page Up" key is used to scroll to the beginning
of a text field or to the top of a list.

Also, the user can use "xev", an X11 client to print contents of X events, to
determine the keyboard mapping. "xev" is normally found in X11 client
distribution. It is available in A/UX X11 Window System. The "xev" program
creates a window and then asks the X server to send "events" whenever anything
happens to the window. Events may include move, resize window, mouse clicked in,
and keyboard typed in, and so forth. These reports can be displayed from the
"Command Output" menu of the "Remote" menu in MacX.
