Macintosh IIfx: Screen Blank during Memory Test

=====================================================================

Article Created: 15 April 1991
Article Last Reviewed: 14 July 1992
Article Last Updated:

TOPIC -----------------------------------------------------------

When I run tests on the Macintosh IIfx, the screen goes blank when it
reaches the memory test.  The unit then remains blank for ten minutes.

DISCUSSION ------------------------------------------------------

The screen goes black during the test.  The amount of time the unit
remains dark depends on the amount of RAM.  This doesn't sound like a
problem.  You might try another, similarly-configured Macintosh IIfx to
see the differences.
