Macintosh: Spooling to Speed Typesetting

======================================================================

Article Created: 25 June 1991
Article Last Reviewed: 26 May 1992

TOPIC -------------------------------------------------------------

I have a typesetter connected to my Macintosh II. When I print, the computer is
tied up for a long time. If I had an AppleShare server and used the print
spooler feature, would this free up my system sooner?

DISCUSSION --------------------------------------------------------

Because the typesetter can be put on a LocalTalk network, it can be captured by
the AppleShare print spooler. This would certainly free up your system sooner.
Alternatively, you should find out if your typesetter supports background
printing directly from your Macintosh. This would also free up your system
sooner. If the option for turning on background printing is available in the
Chooser, try turning it on.
