EtherTalk Installation: How System 6.0.7 and System 7 Differ

======================================================================

Article Created: 13 August 1991
Article Last Reviewed:
Article Last Updated:

TOPIC -----------------------------------------------------------

Will System 6.0.7 and System 7.x automatically install EtherTalk 2.0.2 as
needed for a Macintosh IIfx?

DISCUSSION ------------------------------------------------------

System 6.0.7
------------
System 6.0.7 does not automatically install the EtherTalk Drivers. You must
use the Network Products Installer that comes with the computer. This
correctly installs the Network CDEV and network drivers.

System 7
--------
System 7 automatically installs network drivers and CDEVs -- if a network
card is installed on the computer. If you find that some networking
software you need is not installed, use the Installer program on your
System installation disks and use the Customize option.  The Customize
option lets you install the specific software you want without disturbing
the rest of your system.
