TOPIC -------------------------------------------------------------

Maintenance of the Parallel Data Structure (PDS) in AppleShare 3.0 is a
continuous background task rather than a startup task.

DISCUSSION --------------------------------------------------------

This change has these benefits:

- Faster server startup time

- Improved integrity of the PDS (many other applications can run on the
  same system, increasing the chance of a server crash)

- Ability to support removable media:  The administrator can mount or
  unmount volumes while the server is running.
