Macintosh: Power Supply Requires Grounding

=====

Article Created: 12 April 1991

TOPIC -----

I need Macintosh systems that work with 220VAC 50Hz with no ground.

DISCUSSION -----

All members of the Macintosh SE and Macintosh II families have universal power supplies. They are all set to work from 100-240VAC 50/60Hz.

For safety reasons, Apple cannot recommend using a system with no ground. The equipment might work, but would not be safe to use. If a short were to occur, you would be keeping a circuit breaker from stopping the short by not using a ground.
