TOPIC -----

I'm looking for the video specifications for the Macintosh LC. What are the Macintosh LC video characteristics (such as Horizontal and Vertical frequencies), and are they interlaced? (I understand the Horizontal and Vertical frequencies vary with the monitor.)

DISCUSSION -----

The Macintosh LC has three modes of operation, based on the monitor connected: 12-inch RGB, 12-inch monochrome/13-inch RGB, and VGA. The timings for these Macintosh LC video modes are the same as for other Macintosh models supporting these same monitors.

Monitor	Vertical Refresh Hz	Horizontal Refresh KHz	Dot Clock MHz
-----	-----	-----	-----
12-inch RGB	60.15	24.48	15.7
VGA	59.95	31.47	25.175
12-inch Monochrome and 13-inch RGB	66.7	35	30.2

None of the Macintosh LC video modes uses interlace scan. All modes use a progressive scan.
