Article Last Updated:

TOPIC -----

The Macintosh Display Card 8•24 GC has been upgraded to include a number of new features and improvements in both hardware (a new ROM and CLUT) and software.

DISCUSSION -----

The 8•24 GC Rev B hardware features include timing and color support (32,000 colors) for the 16-inch display. The software makes the GC card fully System 7 compatible, and provides gamma selection for the 16-inch and 21-inch color displays.

No new hardware is required to use the QuickTime extension.

Owners of the 8•24 GC Rev A card will need to have their card upgraded to the new ROM (timing support) in order to use the Macintosh 16-inch Color Display. There is no upgrade path for the CLUT (Color Look Up Table). The Rev B ROM is ONLY needed for the 16-inch display.
