Security Zone: Must Have 16-Character Password

==

TOPIC ---

I installed the Security Zone zone name on a spare port of one of our
MaxWay 500s, and it shows up in the Chooser.

Unfortunately, it doesn't seem to have any effect. When I click on "Answer
calls" in the Remote Access Setup CDEV, it doesn't ask for password -- even
if I click on "entire network."

DISCUSSION --

The problem probably stems from the following:

When you run the Security Zone stack, it displays the name you should give
to the Security Zone. Unless the name is printed, the stack only displays
15 characters of the 16-character password. You probably have a 15-
character password. Therefore, the AppleTalk Remote Access program isn't
treating it as a true Security Zone. Try re-entering the zone name with
the full name from the stack.
