Article Last Updated:

TOPIC -----------------------------------------------------------

This article provides some general tips for using SCSI devices.

DISCUSSION ------------------------------------------------------

- Disconnect, from your computer, any SCSI devices you don't want to start.

- Turn on ALL SCSI devices connected to your Macintosh -- even those you're
  not using -- to avoid problems.

- Turn on SCSI devices before you start up your Macintosh.

- Do not turn off SCSI devices until after you've shut down your Macintosh.

- Ensure that the SCSI chain is properly terminated.  A terminator is
  required on the last available port in a SCSI chain (provided the device
  is not internally terminated).

- Ensure that each SCSI device in the chain has a different ID number.
  There are eight SCSI ID numbers available.

  - ID number 0 is assigned to the Macintosh internal hard drive.
  - ID number 7 is assigned to the Macintosh.
  - ID numbers 1-5 are available for the other SCSI devices in the chain.
