TOPIC -----------------------------------------------------------

This article describes the Apple Keyboard II.

DISCUSSION ------------------------------------------------------

Key Layout
----------
Key location on the Apple Keyboard II differs from the earlier Apple Keyboard:
- The caps lock and control key exchanged places.
- The tilde key is where the escape key was.
- The vertical line key was moved to a new location above the new return key.
- The escape key took the vertical line's old spot.
- The return key was made smaller.
- The space bar was enlarged.

The international ISO version has a new key with ± and § characters and the
escape key replaced the right-hand side command key.

Both keyboards' numeric keypads have the + and - keys reversed.  It is the
same as the extended keyboard.  In addition, this is the same arrangement
as a 10-key adding machine.

With the exception of the arrow and escape keys, Apple Keyboard II has a
layout which is identical to the comparable parts of the Apple Extended
Keyboard II.

Tilt Legs
---------
At the ends on the back, the keyboard has two legs the user can extend to
provide a greater tilt.
```

Compliance

The Apple Keyboard II is fully ANSI and ISO compliant.
