System 7.1: What's New?

=====

Article Created: 19 October 1992

TOPIC -----

What does System 7.1 offer that's different from System 7.0 or 7.0.1?

DISCUSSION -----

System 7.1 includes:

- WorldScript software, which simplifies support of language scripts in Macintosh system software.
- Several new control panels to allow users to customize the formats for dates, times, numbers, and text behavior -- sort and case conversion, for example.
- Improvements made by System 7 Tune-Up 1.1.1.
- The QuickTime software extension that provides multimedia capability for your Macintosh.
- The new Font folder within the System Folder for a single place to store all fonts.
- System Enablers that provide compatibility between Macintosh CPU hardware and system software. Compatibility is achieved by adding a software module, not by reinstalling a new system.
