ColorSync: How It Differs from Ofoto Calibration

==

Article Created: 6 January 1993

TOPIC --

What is the difference between Ofoto calibration and ColorSync matching?

DISCUSSION ---

Ofoto provides a closed-loop device-to-device matching, whereas ColorSync
provides device-independent matching. This means that Ofoto will work as
long as the scan is printed on the intended device. ColorSync provides the
best possible results no matter what the eventual device is.

ColorSync is available only for the Macintosh, and there isn't a
Windows version.
