Language Kit Installers: Crash in 24-bit (2/95)

Article Created: 10 June 1993  
Article Reviewed/Updated: 17 February 1995

### TOPIC -----

If I install one of the Language Kits (with 24-bit addressing ON), the Installer crashes while merging the TrueType fonts. This ONLY happens when installing on Macintosh computers with non 32-bit clean ROMs (Macintosh II, IIX, SE/30, IICx) that also have the 32-bit System Enabler installed.

Installing with 32-bit addressing turned ON has no problems.

### DISCUSSION -----

This problem has been duplicated and reported to Apple engineering. The only workaround at this time is to turn ON 32-bit addressing while installing the Language Kits with these types of Macintosh computers, (Macintosh II, IIX, SE/30, IICx) that have the 32-bit System Enabler installed.

Article Change History:  
17 Feb 1995 - Updated to include both Language Kits.
