Apple Workgroup Server 95: How To Add Volumes (6/93)

==

Article Created: 7 June 1993

TOPIC ---

How do you add AppleShare volumes to the Apple Workgroup Server (AWS) 95?

DISCUSSION --

To add AppleShare volumes to the AWS 95, you need to do the
following:

1) Install AppleShare Pro on the AWS 95.

2) Physically install the new disk drive. Remember that for best
   performance, drives should be attached to a SCSI chain on the PDS card.

3) After restarting A/UX, start up the Apple HD SC Setup program located in
   the Applications folder on the "/" drive.

4) Select both the SCSI bus number and the SCSI id of the new drive, then
   click the Initialize button.

5) When done initializing the disk, click on Partition. Select "File Server
   Data" for the partitioning scheme. Enter the number of equal partitions
   you want on the disk (from 1 to 12). This will create UNIX file
   systems, rather than HFS file systems, which are recommended for better
   performance.

6) Create a mount point for each partition. This is a unique name for each
   partition. By default, the mount points are located under "/ Shared
   Data".

7) After creating a mount point for each partition, click Quit to return to
   the Finder.
