MacCheck: Directory Corruption Detected (8/93)

=====

Article Created: 19 August 1993

TOPIC -----

MacCheck has detected Directory Corruption on my hard disk. What should I do?

DISCUSSION -----

If MacCheck detects directory corruption during its file system test, locate the Disk First Aid program on your Utilities disk (Performa owners) or Disk Tools disk (Macintosh owners.)

Follow the procedure detailed below:

- 1) Shut down your Macintosh from the Finder's Special menu.
- 2) Insert your Utilities or Disk Tools disk and turn on your Macintosh.
- 3) When the Finder appears, run the Disk First Aid * program. (Note: Be careful to designate the drive that MacCheck detected the problem on, as the drive that needs to be fixed.
- 4) Choose Quit to return to the Finder and choose Restart from the Special menu to restart your Macintosh.

* Apple recommends Disk First Aid v7.2, found on the Software Utility Update 1.0 disk, available from AppleLink and other online services.

Occasionally, Disk First Aid versions prior to version 7.2 will not find or fix the problems that MacCheck has detected. If you run MacCheck after running Disk First Aid, MacCheck may still detect file system problems. If this occurs or if MacCheck tells you that it detected problems that Disk First Aid cannot fix, the problems can be corrected by reinitializing your hard drive using Apple HD SC Setup. Please make sure that you have backed up your drive (using Apple Backup if you are a

Perform a user) before reinitializing your drive.

Some third-party utilities may be able to repair problems that Disk First Aid cannot repair. However, reinitializing your drive is the only way to be sure that problems that MacCheck detects are corrected.
