Loading A/UX 3.0.1 On Quadra 610 and Quadra 650 (11/93)

==

Article Created: 8 November 1993

TOPIC ---

I need the installer disk for the Quadra 610 and Quadra 650 not the Centris
computers. Because of the version difference in the enablers of both
Quadra 610, 650 and Centris 610, 650, I cannot boot the Quadra 610, 650
from the current A/UX Installation disk.

DISCUSSION --

The Quadra 610 and Quadra 650 were anticipated in 3.0.1, so the kernel
recognizes their machine ids, but the installation floppy did not contain
the necessary enabler. Keep in mind that A/UX will not work with
68LC040-based Quadra 610 computers. The low-end Quadra 610 (8/160) has the
68LC040.

Here's how to get A/UX running on a Quadra 610 and Quadra 650:

1) Make a copy of the A/UX install boot floppy.
2) Put the enabler for the Quadra 610 and Quadra 650 on the new install
   floppy.
3) Boot up and install normally.
4) Boot off a boot floppy or boot CD. Install the Quadra 610 and Quadra
   650 enabler on the A/UX boot partition.

Things should now work fine. The only glitch is that the A/UX Finder won't
give the correct name for your computer in "About This Macintosh" since
their final names were not available when A/UX 3.0.1 came out.
