HyperCard: Sending HyperTalk in AppleScript (12/93)

=====

Article Created: 2 December 1993

TOPIC -----

How do I embed HyperTalk code in a script that is in the AppleScript environment?

DISCUSSION -----

After setting the language environment to AppleScript:

- Use the command "do script" and enclose the HyperTalk code in quotes.
For example:

```
do script "send mouseUp to card button 5"
```

- Or put AppleScript code in a field, then use something like this:

```
do card field scriptText as AppleScript
```

If the field scriptText has AppleScript code in it, the HyperTalk command will execute it as AppleScript.
