HyperCard: Preventing Users from Interrupting Scripts (7/92)

=====

Article Created: 16 November 1990  
Article Reviewed/Updated: 23 July 1992

TOPIC -----

As a stack developer, how can I stop a user from pressing Command-Period (interrupting an action) during one of my scripts?

DISCUSSION -----

You can't. But if your script involves hiding and showing buttons and fields, here's a way you can make sure the stack is returned to normal in the event a user presses Command-Period during the process: at the start of the script, "set the cantModify of this stack to true". Also, in your idle handler, add the line "the cantModify of this stack to false". That way, if the user cancels during the hiding and showing, the stack will revert to the way it was before the user initiated the action.
