ARA Serial Card and Serial NB Card Differences (1/94)

==

Article Created: 3 January 1994

TOPIC ---

I have a question about the ARA 2.0 MultiPort Server. In the requirements
it mentions the AppleTalk Remote Access Serial Card and RS-232 cable; is
this different from the Apple Serial NB Card and the Hydra cable? If it
is, will the ARA 2.0 support the Apple Serial NB Card?

DISCUSSION --

The ARA Serial Card is the same as the Serial NB Card except for one minor
difference. The resistor packs on the card have been removed so that ports
1A and 1B are configured as RS-232-C ports. If a customer is going to use
an existing Serial NB card with the ARA Server they must remove the
resistor packs in order to configure the card properly for operation.
