HyperCard 2.0 and "Stop Sign" Icon (7/92)

Article Created: 25 September 1990  
Article Reviewed/Updated: 23 July 1992

TOPIC -----

When assigning an icon to a button in HyperCard 2.0, a window will appear showing all icons available for use in your current stack. Near the lower left hand corner of this scrollable window is an icon called "Stop" which looks identical to the "Stop" icon on the Find File dialog box. Normally, in HyperCard, assigning a icon to a button is just a matter of double-clicking on it. However, when you click on the "Stop" icon, nothing happens.

DISCUSSION -----

This is because Apple decided to use some of the same icons found in the System and Finder files, and include them in HyperCard. This helps developers make screen prototype mock-ups quickly. Rather than "re-invent the wheel," Apple simply moved copies of these System/Finder icons into HyperCard via a resource mover. Hence, the System/Finder ID numbers for these icons also got transferred as well into HyperCard.

Icon numbers 0-128 are reserved by the Macintosh operating system for System Use only. Therefore, when HyperCard goes to read the "Stop" icon, and it sees an ID # of 0 (zero), it doesn't know what to do with it. Thus the icon, although selected, never appears.

The workaround is to (from within the icon window) assign an icon number to the stop icon which is greater than 128. This will enable HyperCard to "see" the icon, and display it properly when you assign it to a button. Be sure that this new number is different than all other icons in this stack, otherwise another icon will be overwritten.
