Multiple Scan 20 Display: Older Video Cards Incompatible (4/94)

=====

Article Created: 25 April 1994

TOPIC -----

I have a Macintosh IIfx with an 8-bit video card and a video card for a 21-in Apple Monitor. Can I use either of these cards with the new Apple Multiple Scan 20 Display?

DISCUSSION -----

Apple Computer makes every practical attempt to allow older products, such as the video cards you have mentioned, to function with new state of the art products like the Apple Multiple Scan 20 Display. However, in this particular case it was not possible to incorporate the old video card technology to perform with the new display. So, neither of these cards will operate with the multiple scan display.
