Macintosh Performa: Ferro-Resonant Transformer (5/94)

=====

Article Created: 12 May 1994

TOPIC -----

The user is attaching an uninterruptable power supply (UPS) to their Macintosh Performa and needs to know if the Performa uses a ferro-resonant transformer.

DISCUSSION -----

The Macintosh Performa does not use a ferro-resonant transformer. This type of transformer (large) was used in conjunction with a larger capacitor to produce a constant output voltage [also known as "constant voltage transformer (CVT)"], resonating between 50 and 60 Hz. It is a very old design and the power supply was very heavy, and it is seldom used in the industry.

We recommend that the customer use a true sinewave uninterruptable power supply with all Apple's platforms for best results.
