Multiple Scan 15 Display: Meaning of LED Colors (6/95)

===

Article Created: 29 August 1994
Article Updated: 15 June 1995

TOPIC ---

Why does the LED on Multiple Scan 15 Display change colors?

DISCUSSION --

The LED on the front of the monitor turns amber instead of green if the signal
cable (video cable) is not connected to the CPU or if the monitor is not
detecting a video signal from the cpu. The LED in normal operation is green when
the monitor is turned on. However, the monitor LED does change briefly during a
normal startup.
