Apple Basic Color Monitor: No Support with Macintosh IIfx (9/94)

=====

Article Created: 19 September 1994

TOPIC -----

I have a Macintosh IIfx and cannot get the Apple Basic Color Monitor to work properly on it. I can get the Apple Color Plus display to work with the IIfx and I can get Apple Basic Color Monitor to work from a DOS computers's SVGA port.

DISCUSSION -----

The built-in video technology of the Macintosh IIfx and IIsi do not support the VGA video format. The first Macintosh computer to support the VGA format was the LC.
