AELC: Change ClarisWorks Mem Allocation for Grady Profile 11/94

==

Article Created: 7 November 1994

TOPIC ---

When I try to print from Grady Profile I get the message that there is not
enough memory to launch the program to print the report. I have 4 megabytes of
memory on my Macintosh. What is causing this?

DISCUSSION ---

The Grady Profile application program that comes with the Apple Early Learning
Connection (AELC), only checks the preferred memory size of ClarisWorks (the
application it uses). On a Macintosh computer with limited memory, this causes
the Grady Profile application to display the not enough memory message. To
correct this, change the preferred memory of ClarisWorks to 1100 K.
