Japanese Language Kit: Subscript Katakana Characters? (7/95)

==

Article Created: 10 July 1995

TOPIC ---

The Japanese written language uses Katakana characters to phonetically spell out
many American English words for which there is no Japanese equivalent. Neither
Kanji nor Hiragana are used for phonetically translated American English words.

Is there a way to use the Japanese Language Kit to input a subscript vowel
behind a Katakana character.

For example, the word 'party' is written phonetically 'pa-tei'. Te is a Katakana
character that needs the subscript vowel 'i' behind it to achieve the correct
pronunciation.

DISCUSSION --

As of the date of this article, the Japanese Language Kit does not have the
capability to subscript a vowel behind a Katakana character.

You will need to use a word processor application to subscript the character or
reduce the size of the font to get the desired effect.
