Apple Internet Connection Kit and Static IP Address (12/95)

===

Article Created: 8 December 1995

TOPIC ---

This article describes the procedure to use a static IP address with the Apple
Internet Connection Kit (AICK).

DISCUSSION --

Step 1

Configure the dialer to use your Internet Service Provider (ISP) with the
define/modify provider menu command, then close the dialer WITHOUT dialing and
connecting.

Step 2

If your Macintosh is running TCP/IP, open the TCP/IP control panel, select the
Advanced command in the User Mode menu, then fill in the requisite information.
Close the control panel.

Step 3

Open the dialer and connect to the ISP. The changes to the TCP/IP control panel
will stay, as they are written to a part of the TCP prefs that the dialer does
not overwrite.

Things to Avoid

Never have the MacTCP or TCP/IP control panel and the dialer open at the same
time. Never have ConfigPPP and the dialer open at the same time.

Either of these combinations of operations will cause system and preferences
corruption. Make sure you have quit one process before starting the next.
