Macintosh 5200, 5300, 6200, & 6300: Audio Sampling Rates (1/96)

Article Created: 18 December 1995

Article Reviewed/Updated: 3 January 1995

TOPIC -----

I am using a sound editing application on my Macintosh Performa 5300 computer, but I am unable to get a sampling rate higher than 22.050 kHz. I have also noticed that 22.050 kHz is the only option available in the Sound control panel. Is there any way to get a higher sampling rate?

DISCUSSION -----

Many Macintosh computers support $44.100~\mathrm{kHz}$. However, the entry-level Power Macintosh and Performa 5200, 5300, 6200, and $6300~\mathrm{series}$ computers with $16\mathrm{-bit}$ sound only support $22.050~\mathrm{kHz}$ audio.
