Color OneScanner 600/27: Scanned Image Too Large (3/96)

======================================================================

Article Created: 6 March 1996
Article Reviewed/Updated: 12 March 1996

TOPIC -------------------------------------------------------

When I scan images using my Apple Color OneScanner 600/27, the image is too
large to see on my monitor. How can I view the entire image?

DISCUSSION --------------------------------------------------

If you have scanned an image at 300 dpi, it will be shown initially at four
times its printing size because of the pixel-for-pixel view.  The images are not
dynamtically sized for the size of your monitor.

Here are some tips that can help you when you scan at high resolutions.

• Use PRESCAN and select only the area you need scanned before performing
  a scan.

• If you are using a Multiple Scan Display, change the Resolution before
  launching the OneScanner Dispatcher software.

• Once the image has been scanned, zoom out until you can see the entire
  image on your display.
