Multiple Scan 1705 Display: Viewable Image Size Changes (3/96)

===

Article Created: 22 March 1996

TOPIC ---

I have a Multiple Scan 1705 Display. When I open or close a window that contains
a mostly white background, such as a SimpleText document, the viewable image
grows. For example, when I open a new document in SimpleText, the size of the
image grows by a few millimeters. When the document window is closed, the image
shrinks.

DISCUSSION --

There is nothing wrong with your display. What you describe is normal for the
Multiple Scan 1705 Display and typical of all entry level 17-in. displays.

When you display more white areas on your monitor, this draws more current
causes the screen raster to move slightly. The same size display at a higher
price point contains higher cost circuitry that compensates for the raster
movement.

When using MacTest Pro test patterns (all white screen), the various Apple
Displays all have different levels of raster movement, or high voltage
regulation. This is normal on all displays, regardless of manufacturer.
