AMT 2.0: Play QTVR Movies on Monitor w/ Menu Bar (4/96)

==

Article Created: 17 April 1996

TOPIC ---

I have a Power Macintosh 7500 computer, with two monitors attached. An NEC
17-in. monitor is connected to the video port of the Macintosh, and the other
monitor is a NEC xv15 connected to the computer through an ATI Exclaim video
card. I am working on an Apple Media Tool 2.0 project with QuickTime VR movies.

When I run a QuickTime VR movie and the playback screen is on the xv15 display,
the picture may show on the screen, but never actually plays. If the run window
is moved back to the 17-in. display, the QuickTime VR movie runs properly.

The movies play fine when viewed using QTVR Player.

DISCUSSION --

Apple Media Tool may not display QuickTime VR movies correctly on monitors other
than those that display the menu bar. If this happens, move the Run window so
that it appears on the monitor that displays the menu bar.
