Mac OS 7.6: Not Enough Memory & MetroNub (1/97)

=====

Article Created: 20 January 1997

TOPIC -----

After Installing Mac OS 7.6 on my Power Macintosh 8100 computer, I get an error about not enough memory to initialize the MP API. My system has 96 MB of RAM. What is this, and how much does it need?

DISCUSSION -----

This error message occurs if you have MetroNub 1.2 from MetroWerks installed. On the Code Warrior CD by MetroWerks, they have a document called "MP API FAQs", which is in their Multiprocessing SDK (Software Developer's Kit). MetroWerks states, "The MetroNub debugger extension must have the size specified in its 'sysz' resource increased to 2,580,000 bytes. Use ResEdit or Resourcer to do this."

Please refer to the CD-ROM disc mentioned above, or the System 7.6 Tech Note published by Developer Technical Support.
