Mac OS 7.6: About Multiprocessing Software Read Me (1/97)

Article Created: 24 January 1997

TOPIC -----

This article is the About Multiprocessing Software ReadMe file.

DISCUSSION -----

Important Information
About the Multiprocessing Software

This document provides information about the multiprocessing (MP) software included with Mac OS 7.6 and how to configure your computer properly to take advantage of multiprocessor performance. You use multiprocessing software to use two processors at the same time, which increases your computer's speed. Multiprocessing software is only installed on computers with more than one PowerPC processor.

CORRECTION: Mac OS 7.6 will install the MP Software folder into the Extensions folder on every PowerPC-based computer, no matter how many processors.

Turn off virtual memory and do not install RAM Doubler

Turn off virtual memory in the Memory control panel, and do not install Connectix RAM Doubler software. If virtual memory is turned on or RAM Doubler is installed, then your multiprocessor-compatible software applications will not be able to take advantage of the second PowerPC processor.

To turn off virtual memory, open the Memory control panel. In the Virtual Memory section, click the Off button. Then restart your computer. For more detailed information about virtual memory, see the topics on memory in Mac OS Guide, available in the Guide menu.

Turn off hard disk sleep

Make sure that the hard disk sleep interval is set to "Never" in the Energy

Saver control panel. Otherwise, software applications designed to work with your multiprocessor computer may not work properly.

To set your hard disk sleep interval, do the following:

- 1) Open the Energy Saver control panel.
- 2) If necessary, click Show Details to make the additional options available.
- 3) Drag the top and bottom sliders as shown below.

If you wish, you can set a display sleep interval by dragging the middle slider. Display sleep works properly with multiprocessor-compatible software applications.

Important information about Document Auto-Save

The Energy Saver control panel contains a feature named "Document Auto-Save." The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Mac OS (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When Document Auto-Save is incompatible with an application, it will either not automatically quit, or it will display alerts or dialog boxes that Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave open no documents that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel so the computer will sleep rather than shut down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Mac OS Guide from the Guide menu when the Finder is active.
